

AMENDMENTS TO THE SPECIFICATION

Please replace all prior versions of the Abstract with the following:

A user interface for wireless communications device includes a component to compose a destination for an outgoing communication generated by the device. The component provides for alternative composition ~~means~~ comprising a prompt for receiving the destination from a user and a list of candidate destinations from which the user may select the destination. The component may be invoked directly from a home screen of the user interface by keying the destination. Entry from the main screen may populate the prompt with the keyed destination to speed calling operations.
